## Supplementary Material B

This second part of the Supplementary Material is composed by a descriptive analysis from the three scenarios from the Section 5, as well as other results that demonstrate the better performance of the RM over the RF.

Table 1: Descriptive statistics from the predictors variable of the Bolsa-Familia database.

| Variables | Median | Mean | SD | CV | Min. | Max. |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| CLR | 1.235 | 1.594 | 1.427 | 89.562 | 0.130 | 10.970 |
| DLR | 0.925 | 1.221 | 1.125 | 92.105 | 0.130 | 7.140 |
| Kx1 | 0.105 | 0.150 | 0.241 | 160.878 | -0.500 | 1.160 |
| Kx2 | 0.980 | 1.118 | 0.634 | 56.722 | 0.130 | 4.390 |
| Kx3 | 0.915 | 1.215 | 1.127 | 92.741 | 0.130 | 7.140 |
| Kx4 | 1.235 | 1.593 | 1.427 | 89.572 | 0.130 | 10.970 |
| Kx5 | 1.825 | 2.096 | 2.093 | 99.879 | -3.100 | 11.140 |

Table 2: Description of each category created in the study's questionnaire. The score evaluated in them give the information about the attendance of determined feeling in the transcription.

| Predictor | Description |
| :--- | ---: |
| CAT1 | Love as a relationship between specific people is not necessarily romantic |
| CAT2 | Love as something essential/fundamental to human beings and/or humanity |
| CAT3 | Love as something indefinable, ineffable, ethereal |
| CAT4 | Love as something linked to sexual components |
| CAT5 | Love as a romantic relationship between two people |
| CAT6 | Love for family members |
| CAT7 | Love as something geared towards family members |
| CAT8 | Love as something geared towards friends |
| CAT9 | Love towards divine or supernatural entities |
| CAT10 | Love towards irrational animals |
| CAT11 | Love towards inanimate beings |
| CAT12 | Self-directed love |
| CAT13 | Love as a source of positive emotions, attitudes and behaviors |
| CAT14 | Love as a source of negative emotions, attitudes and behaviors |

Analyzing the age distribution from the histogram presented in Figure 1 it can seem that for that study the distribution of age groups is asymmetric, where most of people are under their twenties.

Figure 1: The histogram from ages show a degree of asymmetry between age groups.

Figure 2: The histogram from ages by gender shows that the trend of younger people that attended the questionnaire.

Table 3: Summary statistics of independent variables from the model.

| Covariate | Min | Max | Mean | SD |
| :--- | ---: | ---: | ---: | ---: |
| CAT1 | 0.000 | 4.000 | 0.138 | 0.409 |
| CAT2 | 0.000 | 5.000 | 0.115 | 0.457 |
| CAT3 | 0.000 | 5.000 | 0.198 | 0.557 |
| CAT4 | 0.000 | 8.000 | 0.093 | 0.433 |
| CAT5 | 0.000 | 4.000 | 0.299 | 0.578 |
| CAT6 | 0.000 | 7.000 | 0.496 | 0.952 |
| CAT7 | 0.000 | 2.000 | 0.232 | 0.435 |
| CAT8 | 0.000 | 2.000 | 0.074 | 0.281 |
| CAT9 | 0.000 | 2.000 | 0.041 | 0.208 |
| CAT10 | 0.000 | 11.000 | 0.287 | 0.918 |
| CAT11 | 0.000 | 4.000 | 0.041 | 0.253 |
| CAT12 | 0.000 | 12.000 | 2.244 | 2.311 |
| CAT13 | 0.000 | 8.000 | 0.365 | 0.933 |
| CAT14 | 0.000 | 7.000 | 0.821 | 1.140 |
| Age | 14.000 | 73.000 | 23.830 | 11.808 |

Figure 3: Percentage of responses in each category of love.

Figure 4: Histograms for each of the love categories.

Table 4: Variables that compose the third real-world application.

| Variable | Description |
| :--- | :--- |
| y | Rate of use of social assistance program by municipality |
| COD_UF | Code to identify the Brazilian state that the city belongs |
| $\mathrm{T}_{-}$DENS | \% of the population living in households with density <br> greater than 2 people per bedroom |
| TRABSC | \% of employed persons aged 18 or over who are <br> employed without a formal contract |
| PPOB | Proportion of people vulnerable to poverty. <br> T_NESTUDA_NTRAB_MMEIO <br> \% of people aged 15 to 24 who do not study or <br> work and are vulnerable to poverty |
| RAZDEP | \% of the population aged 15 to 17 with complete <br> primary education |
| T_ATRASO_0_BASICO | Dependency ratio <br> T_AGUA of the population aged 6 to 17 years attending basic <br> education that does not have an age-grade delay |
| REGIAO | \% of the population living in households with <br> running water |

Table 5: Descriptive statistics from the continuous variable of the database.

| Variable | Median | Mean | SD | CV | Min. | Max |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| y | 0.095 | 0.101 | 0.057 | 0.561 | 0.001 | 0.246 |
| T_DENS | 23.065 | 25.127 | 13.000 | 0.517 | 0.650 | 88.640 |
| TRABSC | 24.755 | 25.226 | 9.853 | 0.391 | 3.030 | 62.230 |
| PPOB | 42.235 | 43.996 | 22.437 | 0.510 | 1.970 | 91.570 |
| T_NESTUDA_NTRAB_MMEIO | 13.670 | 14.777 | 8.751 | 0.592 | 0.000 | 55.250 |
| T_FUND15A17 | 55.415 | 54.751 | 15.506 | 0.283 | 6.890 | 96.810 |
| RAZDEP | 49.595 | 51.488 | 8.949 | 0.174 | 29.170 | 118.040 |
| T_ATRASO_0_BASICO | 60.980 | 60.657 | 12.037 | 0.198 | 23.840 | 92.480 |
| T_AGUA | 90.280 | 85.596 | 14.722 | 0.172 | 0.150 | 100.000 |

Figure 5: Proportion of the comparison status between random machines and the other methods. It can be noticed that for that task RM outperformed the single SVM algorithms and have an equivalent performance with respect to RF, in the first real-world application.

Figure 6: Proportion of win-tie-loose ratio between the random machines and the other models from the gender prediction.

Figure 7: Proportion of the number of times that RM presented a lower RMSE than other methods, from the bolsa familia application.
